

NexPay Journey Maps

Step by step journeys for each persona

Bilal, overseas remitter

Stage	Touchpoint	User does or thinks	Emotion	Friction and opportunity
Awareness	Friend referral, social ad	Hears NexPay charges a flat 0.1 percent fee and settles in under a second. Downloads the app on payday evening	Positive	Lead with the 0.1 percent fee and speed versus his usual exchange house in the very first screen
Onboarding	Onboarding slides	Swipes through slides on countries covered, settlement speed, and flat fee	Positive	Slides build confidence, but he still does not know if his family can receive without a wallet
Sign up and KYC	Registration form, ID and selfie upload, OTP	Enters username, email, phone, and password, then photographs ID front and back and a selfie, adds address, enters OTP	Negative	Multi step KYC on a small screen at night feels long. No visible progress indicator or reassurance about why data is needed
Wallet connect	Phantom or Solflare wallet connect prompt	Is asked to connect a Solana wallet he has never used before	Negative	Wallet language is unfamiliar. A guided explanation of what a wallet is and why he needs one is missing
Funding the wallet	Wallet screen, assets and top up	Looks for a way to convert his AED cash or salary into USDC to send	Mixed	On and off ramp from local currency is not obvious in app. He may need an external step first, breaking the flow
Sending money	Send money, amount, currency, recipient address	Enters amount, selects PKR, pastes his family recipient address, sees live fee and converted PKR amount	Positive	The real time fee and net PKR preview builds trust. A recipient nickname would reduce fear of a wrong address
Confirmation	Confirm screen and transaction signature	Confirms transfer, sees success state and an explorer link	Positive	A notification to his family the moment funds land would resolve his biggest anxiety
Cash out for family	Outside app, family cash out method	Family needs to convert received USDC into usable PKR cash	Negative	The app does not yet show how an unbanked or non crypto recipient converts to cash, a real adoption blocker
Ongoing use	Transaction history	Checks history each payday to confirm past transfers and reuse recipient details	Positive	A repeat transfer shortcut for his recurring monthly send would help

Sana, freelance recipient

Stage	Touchpoint	User does or thinks	Emotion	Friction and opportunity
Awareness	Client mentions stablecoin payment	A UK client asks if she can accept USDC directly. She searches for a reliable app	Mixed	Content targeting accepting USDC from international clients would capture her at this moment

Stage	Touchpoint	User does or thinks	Emotion	Friction and opportunity
Sign up and KYC	Registration, ID and selfie, address, OTP	Completes KYC in one sitting at her desk, since she is used to onboarding for SaaS and finance tools	Positive	Thorough KYC actually reassures her the platform is compliant and real
Wallet connect	Phantom wallet connect	Connects an existing Phantom wallet, since she has minor prior crypto exposure	Positive	Smooth for her segment, but no in app guidance yet for recipients without a wallet already set up
Requesting payment	Receive screen, QR code, address, payment link	Generates a payment request link with a specific USDC amount and copies it to send to her client	Positive	Link shows a raw Solana address format. A client friendly branded page would look more professional
Receiving funds	Notifications, balance update	Watches for a notification confirming the client payment has landed	Positive	An instant notification on incoming payment, not just a balance refresh, would end the checking loop
Converting to local currency	Wallet, assets and swap tab	Looks for a way to convert received USDC to PKR cash for daily expenses	Negative	Swap currently supports USDC to SOL, not a clear USDC to PKR cash out. This is her biggest blocker
Record keeping	Transaction history, transaction detail	Reviews past client payments with dates, amounts, and explorer links for her own records	Positive	An exportable statement per client or month would save manual bookkeeping work
Ongoing use	Settings, profile tier	Notices Free, Pro, and Business tiers and wonders if upgrading unlocks better rates or limits	Mixed	A clearer in app explanation of what each tier unlocks would help her decide

Hamza, power user and early adopter

Stage	Touchpoint	User does or thinks	Emotion	Friction and opportunity
Discovery	Crypto community, GitHub, devnet demo	Finds NexPay through a crypto community post referencing its Anchor program on Solana devnet	Positive	Publishing the program ID, audit status, and devnet explorer links openly builds instant credibility
Onboarding and KYC	Registration, ID and selfie, OTP	Moves through onboarding quickly, slightly impatient with document upload steps	Mixed	No option to skip for devnet testing. He wants to explore before fully verifying with KYC
Wallet connect	Wallet adapter, Phantom or Solflare	Connects his existing wallet in seconds. Checks whether it auto detects an existing NexPay account	Positive	Smooth. Matches his mental model from other Solana apps
Exploring the wallet	Wallet screen, assets and swap, top up tabs	Reviews USDC, SOL, and USDT balances, notices USDT is marked coming soon, tries the swap feature	Mixed	Incomplete features signal the product is not production ready. A public roadmap would help
Testing send and receive	Send money, receive, QR, request link	Sends test USDC to a second wallet, generates a payment link, checks live fee and rate calculations	Positive	Real time fee math and instant confirmation meet his expectations for a fast product

Stage	Touchpoint	User does or thinks	Emotion	Friction and opportunity
Verifying trust and security	Settings, admin controls awareness	Digs into what freeze wallet, update KYC status, and pause platform mean for user control versus admin power	Negative	Admin freeze and pause capability without a public explanation reads as centralization risk
Devnet limits	Airdrop or faucet flow on receive screen	Uses the devnet SOL airdrop and looks for a USDC faucet to keep testing without real funds	Mixed	Being redirected externally for a USDC test faucet breaks the flow
Advocacy or churn	Community forums, social	Decides whether to recommend NexPay to his network or post critical feedback	Positive	A visible changelog and responsiveness to feedback converts him into an advocate rather than a critic
