

NexPay User Personas

Three core user segments for the NexPay app

Bilal Ahmed

Overseas remitter. Warehouse supervisor, Dubai, UAE

"I just need the money to land before my mother needs it, and I do not want the exchange to eat half of it."

Quick facts

- Age: 34
- Location: Dubai, UAE (works). Lahore, Pakistan (family)
- Occupation: Warehouse supervisor, logistics company
- Sends: 400 to 600 dollars monthly to family, converted to PKR
- Devices: Mid range Android phone, shared home WiFi and mobile data
- Tech comfort: Comfortable with WhatsApp and banking apps. New to crypto wallets

Goals

- Get money to family in Lahore as fast and cheaply as possible
- Avoid long queues at exchange houses or bank branches on his one day off
- Be confident the transfer actually arrived before his family needs it
- Understand exactly how much his family will receive in PKR before he sends

Pain points

- Traditional remittance fees and poor exchange rates quietly shrink each transfer
- Bank or exchange transfers can take one to three days, causing anxiety around bill deadlines
- Unfamiliar with Solana wallets. Worried about losing money to a mistyped address
- KYC document uploads, ID and selfie, feel invasive and slow on a small phone screen
- His family has no crypto wallet, so he still needs an easy cash out path for them

Context

Bilal works long shifts and only has reliable time to manage money in the evening or on his weekly rest day. He has used hawala style exchanges and bank wires before and is price and trust sensitive. He would try NexPay because a friend told him the fee is much lower than his usual exchange house, but he needs early wins, such as a fast first transfer and a clear confirmation, to trust it with a full paycheck.

Sana Raza

Freelance recipient. Freelance brand designer, Karachi, Pakistan

"I finish the work in a day. I should not have to wait a week and lose a chunk of it just to get paid."

Quick facts

- Age: 28
- Location: Karachi, Pakistan
- Occupation: Freelance designer, three to five international clients
- Receives: Payments in GBP, EUR, and USDC, several times a month
- Devices: Laptop for work, iPhone for banking and payments
- Tech comfort: High. Uses multiple SaaS tools, some exposure to crypto exchanges

Goals

- Receive client payments quickly without excessive platform or bank cut
- Have a simple, professional way to share a payment request link with clients
- Convert incoming stablecoins to local currency without manual back and forth

- Keep clean records of income for her own bookkeeping and tax filing

Pain points

- Existing payment platforms, wire transfers and PayPal style tools, charge high fees and hold funds
- Clients abroad find local bank transfers to Pakistan slow or unsupported
- Worried about regulatory and KYC status. Wants to feel like a verified, legitimate user, not a loophole
- No visible option yet to swap received USDC into PKR inside the app
- Rate fluctuations between invoicing and receiving funds can eat into her margin

Context

Sana treats payments as part of her professional image. A clunky or untrustworthy payment flow reflects on her. She researched NexPay after a client mentioned stablecoin payments, and evaluates it mainly on how professional the receive and request link experience feels and how quickly she can turn USDC into spendable PKR.

Hamza Sheikh

Power user and early adopter. Software engineer, Islamabad, Pakistan

"I already live in Phantom and Solana apps. I just want the payments layer to be just as fast."

Quick facts

- Age: 26
- Location: Islamabad, Pakistan
- Occupation: Software engineer, uses crypto as a hobby and side interest
- Holds: USDC and SOL. Comfortable managing his own wallet keys
- Devices: Personal laptop and Android flagship phone
- Tech comfort: Very high. Early adopter, reads changelogs and audit reports

Goals

- Move stablecoins between friends and vendors instantly with near zero fees
- Track balances across USDC, SOL, and USDT once available, in one clean view
- Test new features early, such as swap and top up, and give feedback
- Feel confident about the security model, including freeze and admin controls, before recommending it to others

Pain points

- Impatient with any onboarding step that feels redundant given his existing wallet setup
- Wants transparency on program upgrade authority, admin freeze powers, and fee change controls
- Notices unfinished or placeholder states, such as USDT marked coming soon, and questions production readiness
- Expects instant, accurate balance refresh. Any lag reads as a bug, not a feature
- Wants reliable wallet adapter behavior across Phantom and Solflare without edge case failures

Context

Hamza is the kind of user who becomes an unpaid advocate if the product impresses him technically, or a vocal critic on forums if it feels unfinished. He explores every screen, including Settings, Notifications, and swap, rather than just the core send and receive flow, and is likely to be an early tester on devnet before trusting mainnet funds.
